

These hands-on activities allow you to practice predictive modeling using JMP. Extract the data in **Predictive Modeling Hands-on Activity.zip** for use in the following activities. The solutions follow the instructions for the activities.

Continuous response, continuous predictors

1. Use the data in Practice 1.jmp to build predictive models. These data were collected over time.
 - a. Visualize the data using Graph Builder and Multivariate. Are there any data problems?
 - b. Build a response surface model using Fit Model and the Response Surface macro. What is the R^2 of the full model? Are there any problems with the model fit seen in the Residual by Predicted plot? Which predictor variables are most important for predicting Y? Save the prediction formula to the data table.
 - c. Build a neural network model using the default settings of the Neural platform. What is the R^2 of the model on the validation set? Are there any problems with the model fit seen in the Residual by Predicted plot? Fit another model with 50 nodes. Does this model have appreciably better predictive capability? Save the prediction formula to the data table.
 - d. Build a decision tree model using the Partition platform with a 25% validation set. What is the R^2 of the model on the validation set? How many splits are in the model? Are there any problems with the model fit seen in the Actual by Predicted plot? Which variables are most important for predicting Y? Save the prediction formula to the data table.
 - e. Build an Actual by Predicted graph for the three models using Graph Builder. Which model do you prefer?

Categorical response, continuous and categorical predictors

2. Use the data in Practice 2.jmp to build predictive models.
 - a. Visualize the data using Graph Builder. Are there any data problems?
 - b. Build an ordinal regression model using Fit Model and the Response Surface macro. What is the misclassification rate of the full model? Hint: open the Fit Details report. What is the misclassification rate for the Acceptable group? Hint: open the Confusion Matrix report.
 - c. Build a neural network model using the default settings of the Neural platform. What is the misclassification rate of the model on the validation set? In particular, what is the misclassification rate of the Acceptable group? Fit another model with 50 nodes. What is the misclassification rate of the model on the validation set? What is the misclassification rate of the Acceptable group?
 - d. Build a decision tree model using the Partition platform with a 25% validation set. What is the misclassification rate of the model on the validation set? What is the misclassification rate of the Acceptable group?

Solutions

Continuous response, continuous predictors

1. Use the data in PM 1.jmp to build predictive models. These data were collected over time.
 - a. Visualize the data using Graph Builder and Multivariate. Are there any data problems?
 - 1) Open **PM 1.jmp**.

PM 1		Y	X1	X2	X3	X4	X5	X6	X7	X8	X9	X10
1	54.574	12.04	4.07	6.96	21.79	32.22	31.74	10.04	28.81	29.1	9.86

Build a time plot

- 2) Select **Graph > Graph Builder**.
- 3) Drag **Y** to the Y zone.
- 4) Right-click **Y** and select **Row > Row**.
- 5) Drag **Row** to the X zone.

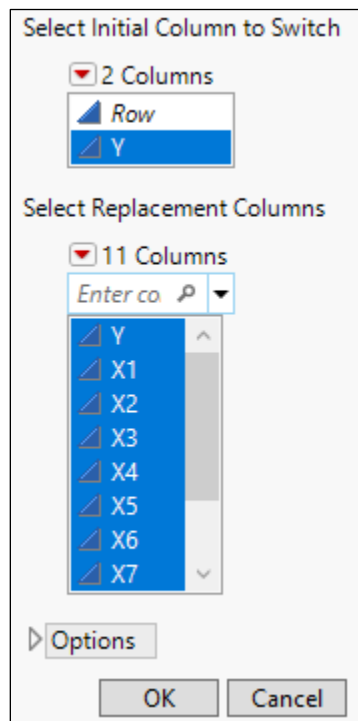

6) Click **Done**.

The data appear to be correlated over the rows. In this case, the rows correspond to time order. The mean and variability of the response appear to be constant over time. Add a column switcher to reproduce this graph for the predictor variables.

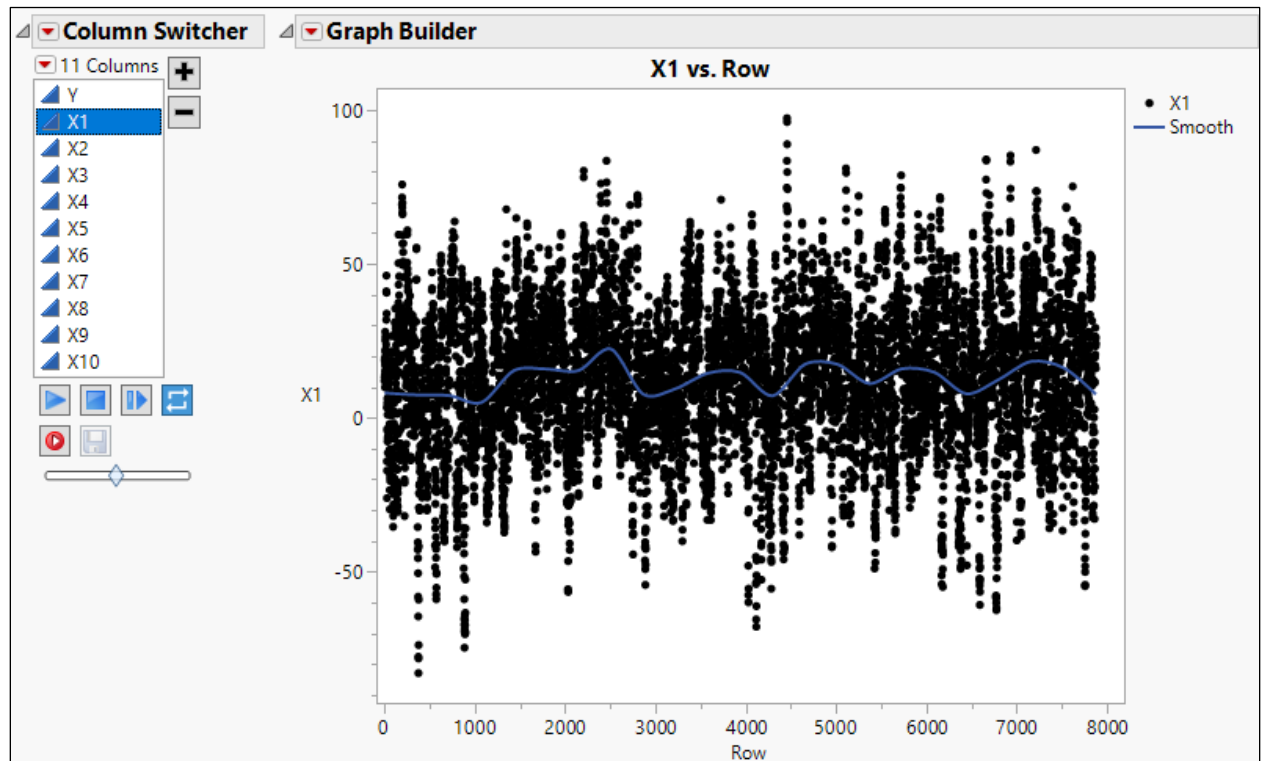

- 7) Click the red triangle next to **Graph Builder** and select **Redo > Column Switcher**.
- 8) Select **Y** from the Select Initial Column to Switch box.

- 9) Select all columns from the Select Replacement Columns box.

- 10) Click **OK**.

- 11) Click on each variable in the Column Switcher in turn.

Many variables appear autocorrelated. No other data problems are evident. Save the script to the data table.

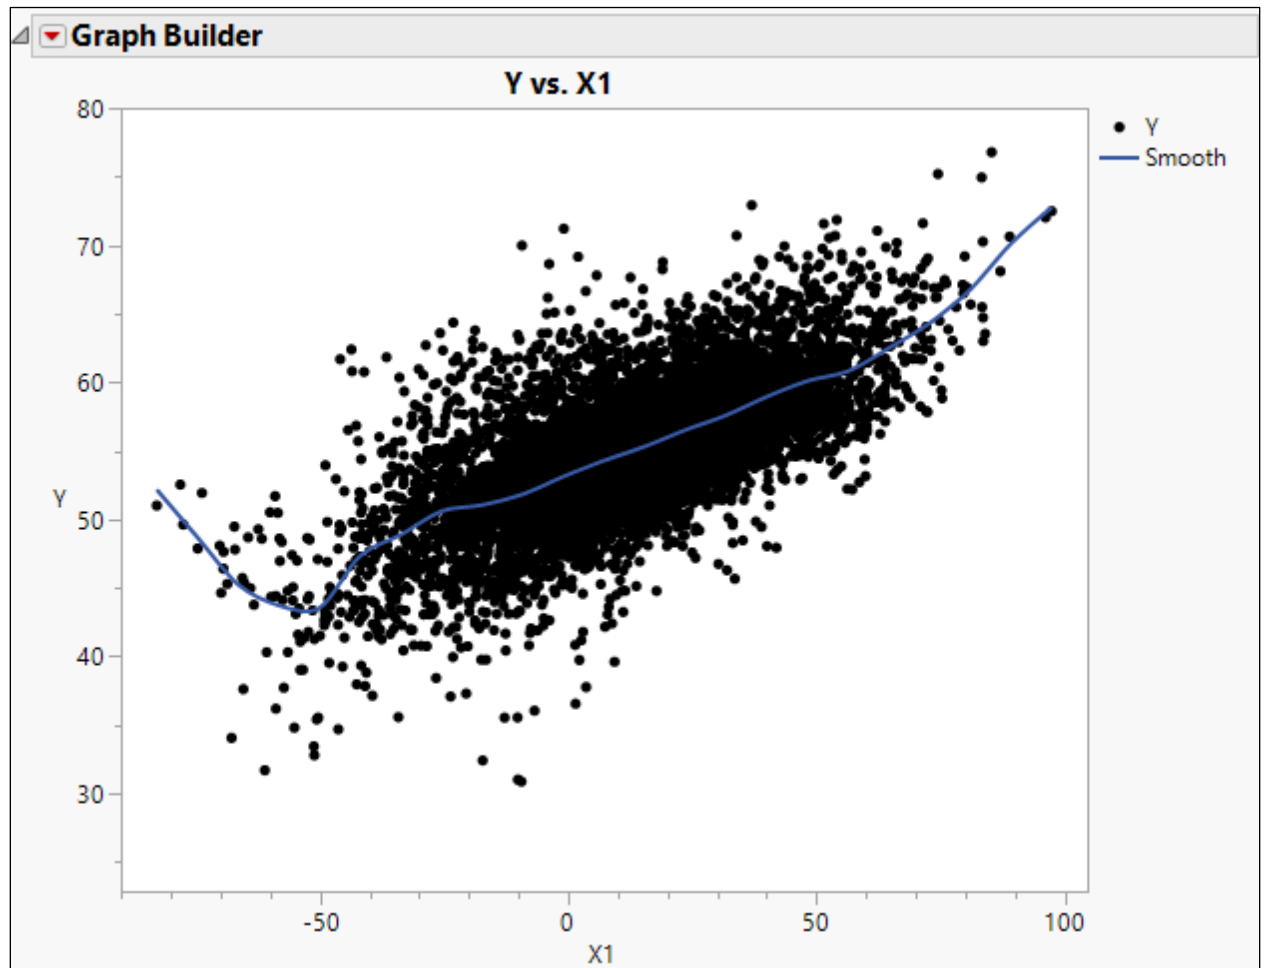

- 12) Click the red triangle next to **Graph Builder** and select **Save Script > To Data Table**.
 13) Enter **Time Plot** for the name.

- 14) Click **OK**.

Build a scatter plot

- 1) Select **Graph > Graph Builder**.
- 2) Drag **Y** to the Y zone.
- 3) Drag **X1** to the X zone.

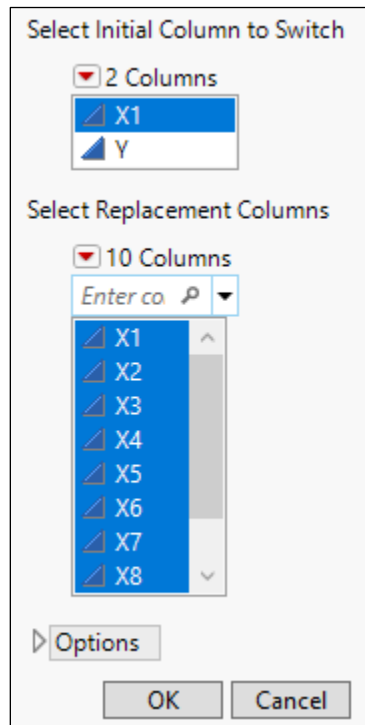

- 4) Click **Done**.

The relationship between Y and X1 appears strong, positive, and linear. Add a column switcher to reproduce this graph for other predictors.

- 5) Click the red triangle next to **Graph Builder** and select **Redo > Column Switcher**.

- 6) Select all columns in the Select Replacement Columns box.

- 7) Click **OK**.
- 8) Click on each variable in the Column Switcher in turn.

Other relationships are also strong. Save the script to the data table.

- 9) Click the red triangle next to **Graph Builder** and select **Save Script > To Data Table**.
- 10) Enter **Y vs. Predictors** for the name.

Name: vs. Predictors

Duplicate name handling: Append unique suffix
 Replace existing script

OK Cancel Help

- 11) Click **OK**.

Another way to view the relationships among variables is with the Multivariate platform.

Multivariate

- 1) Select **Analyze > Multivariate Methods > Multivariate**.
- 2) Select all columns, then click **Y, Columns**.

Explores correlations among multiple numeric variables.

There are many large positive (blue) and negative (red) correlations among the variables.

The same scatter plots that you created in Graph Builder can be seen all at once in the Scatterplot Matrix.

- 4) Click the red triangle next to **Multivariate** and select **Color Maps > Color Map on Correlations**.

This color map duplicates the information in the correlation matrix but might be easier to read.

No data problems other than the autocorrelation, are detected. Save the script to the data table.

- 5) Click the red triangle next to **Multivariate** and select **Save Script > To Data Table**.
 - 6) Click **OK**.
 - 7) Save the data table.
- b. Build a response surface model using Fit Model and the Response Surface macro. What is the R^2 of the full model? Are there any problems with the model fit seen in the Residual by Predicted plot? Which predictor variables are most important for predicting Y? Save the prediction formula to the data table.
- 1) Select **Analyze > Fit Model**.
 - 2) Select **Y**, then click **Y**.

- 3) Select **X1** through **X10**, then click **Macros > Response Surface**.

 5) Close the Effect Summary report.

Summary of Fit	
RSquare	0.889623
RSquare Adj	0.888704
Root Mean Square Error	1.635233
Mean of Response	55.07844
Observations (or Sum Wgts)	7875

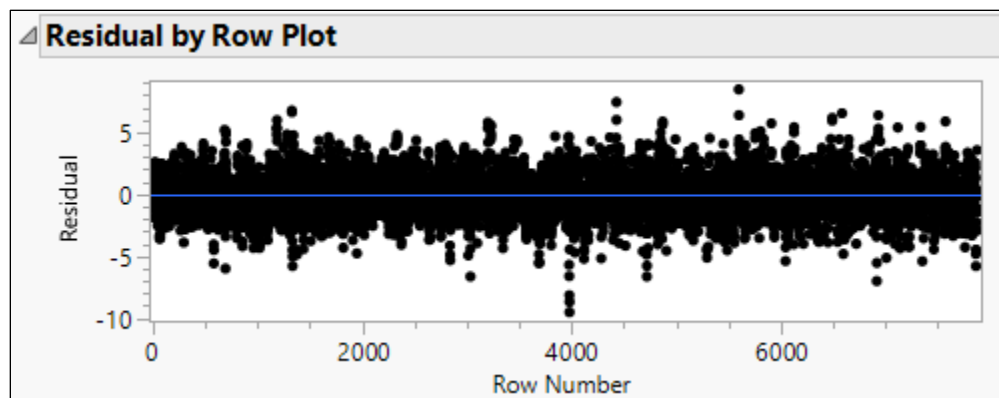

R^2 is about 89%, meaning that 89% of the variability in Y is explained by this model. One standard deviation of the unexplained variability is about 1.6. Check model assumptions.

- 6) Click the red triangle next to **Response Y** and select **Row Diagnostics > Plot Residual by Predicted**.

No problems are seen in the residual plot. Plot the residuals in time order (row order).

- 7) Click the red triangle next to **Response Y** and select **Row Diagnostics > Plot Residual by Row**.

Autocorrelation in the residuals is also seen. Examine the Actual by Predicted plot to see how much the autocorrelation affects the predictions.

- 8) Click the red triangle next to **Response Y** and select **Row Diagnostics > Plot Actual by Predicted**.

No bias is seen in the predictions.

Because there are so many observations, looking at p -values to determine variable importance indicates that all variables are important. See the Parameter Estimates report. To find the most important variables, examine the Effect Summary report.

- 9) Open the Effect Summary outline.

Source	Logworth	PValue

X10	7.091	0.00000
X2*X10	5.389	0.00000
X9	5.028	0.00001 ^

The most important variables for predicting Y are X3, X1, X4, X2, and X5. All main effects and many two-factor interactions are important.

Save the prediction formula.

- 10) Click the red triangle next to **Response Y** and select **Save Columns > Prediction Formula**.
 - 11) Return to the data table and rename the last column as **Pred Y RS**.
 - 12) Save the data table.
- c. Build a neural network model using the default settings of the Neural platform. What is the R^2 of the model on the validation set? Are there any problems with the model fit seen in the Residual by Predicted plot? Fit another model with 50 nodes. Does this model have appreciably better predictive capability? Save the prediction formula to the data table.
- 1) Select **Analyze > Predictive Modeling > Neural**.
 - 2) Select **Y**, then click **Y, Response**.
 - 3) Select **X1** through **X10**, then click **X, Factor**.
 - 4) If you want your results to match this solution, enter 98765 as the random seed.

Predicts one or more response variables using a flexible function of the input variables.

Select Columns	Cast Selected Columns into Roles	Action

Hidden Nodes

6) Click **Go**.

Model NTanH(3)			
Training		Validation	
Y		Y	
Measures	Value	Measures	Value
RSquare	0.8816073	RSquare	0.8809392
RASE	1.697623	RASE	1.6680197
Mean Abs Dev	1.3222562	Mean Abs Dev	1.282874
-LogLikelihood	10227.88	-LogLikelihood	5067.7611
SSE	15130.1	SSE	7303.5107
Sum Freq	5250	Sum Freq	2625

R^2 on the validation set is about 88%. Examine the model diagnostics.

7) Click the red triangle next to **Model NTanH(3)** and select **Plot Residual by Predicted**.

- 8) Click the red triangle next to **Model NTanH(3)** and select **Plot Actual by Predicted**.

No model problems are evident. Fit a model with more nodes to see if it improves the fit.

- 9) Open the **Model Launch** outline.
 10) Enter 50 in the Hidden Nodes box.
 11) Click **Go**.

Model NTanH(50)			
Training		Validation	
Y		Y	
Measures	Value	Measures	Value
RSquare	0.8998253	RSquare	0.8895211
RASE	1.5615568	RASE	1.6067805
Mean Abs Dev	1.2157681	Mean Abs Dev	1.2409576
-LogLikelihood	9789.2644	-LogLikelihood	4969.5739
SSE	12801.913	SSE	6777.0766
Sum Freq	5250	Sum Freq	2625

R^2 on the validation set has increased by less than one percent. RASE and Mean Abs Dev are lower in the second decimal place. The model is not appreciably better.

Save the prediction formula from the model with three nodes.

Note: JMP Pro has the capability of adding nodes of other activation functions. If you have nonstationary data collected over time, that is, if the mean is drifting over time, it is recommended to add one linear node as well. For this data set, because the autocorrelation is stationary, adding one (or more) nodes with linear activation functions does not improve the predictive power of the model appreciably.

Save the prediction formula for the simpler model, then save the analysis.

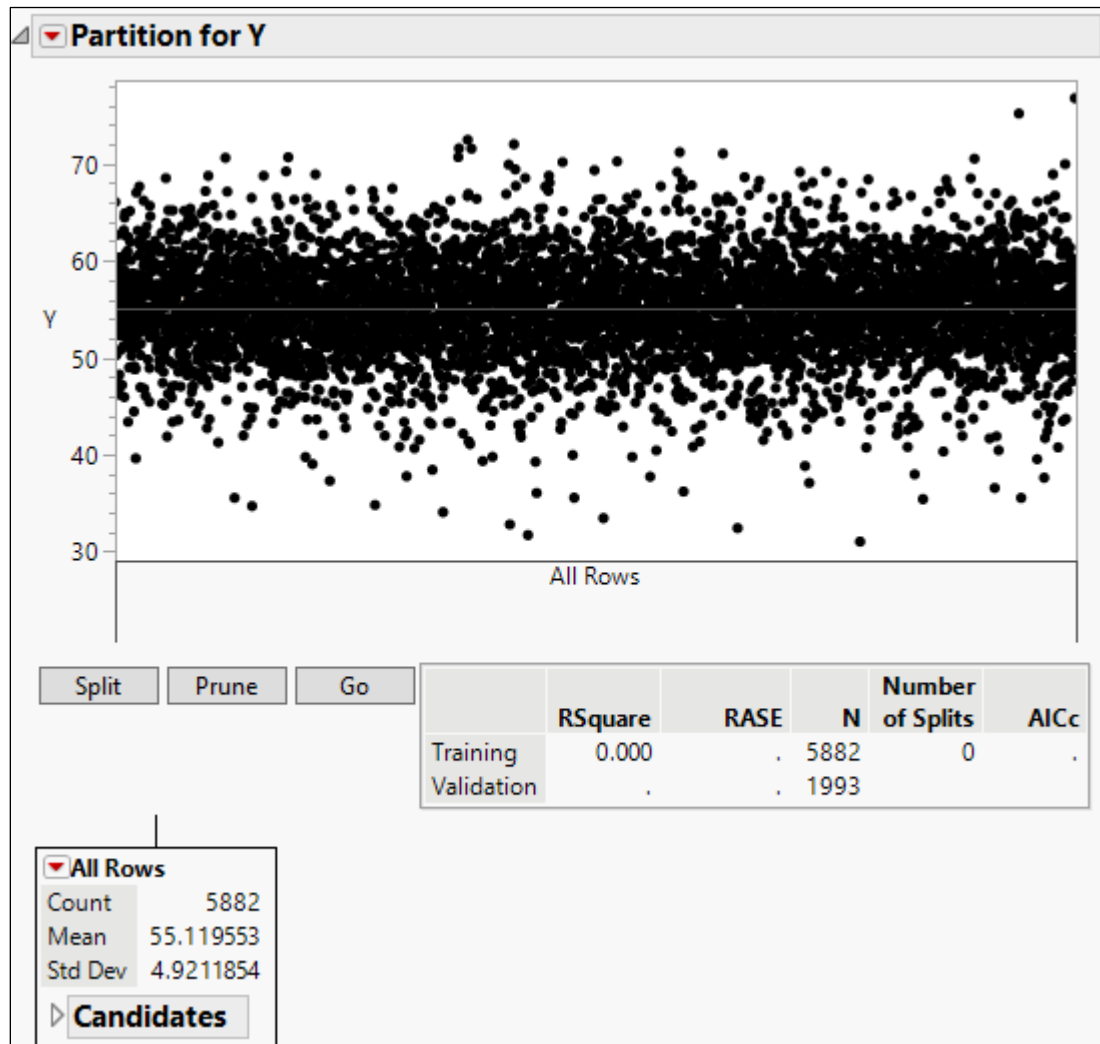

- 12) Click the red triangle next to **Model NTanH(3)** and select **Save Profile Formulas**.
 13) Return to the data table and rename the last column as **Pred Y NN**.

- 14) Return to the Neural report, then click the red triangle next to **Neural** and select **Save Script > To Data Table**.
 - 15) Click **OK**.
 - 16) Save the data table.
- d. Build a decision tree model using the Partition platform with a 25% validation set. What is the R^2 of the model on the validation set? How many splits are in the model? Are there any problems with the model fit seen in the Actual by Predicted plot? Which variables are most important for predicting Y? Save the prediction formula to the data table.
- 1) Select **Analyze > Predictive Modeling > Partition**.
 - 2) Select Y, then click **Y, Response**.
 - 3) Select **X1** through **X10**, then select **X, Factor**.
 - 4) For Validation Portion, enter 0.25.

Builds a decision tree to predict a response.

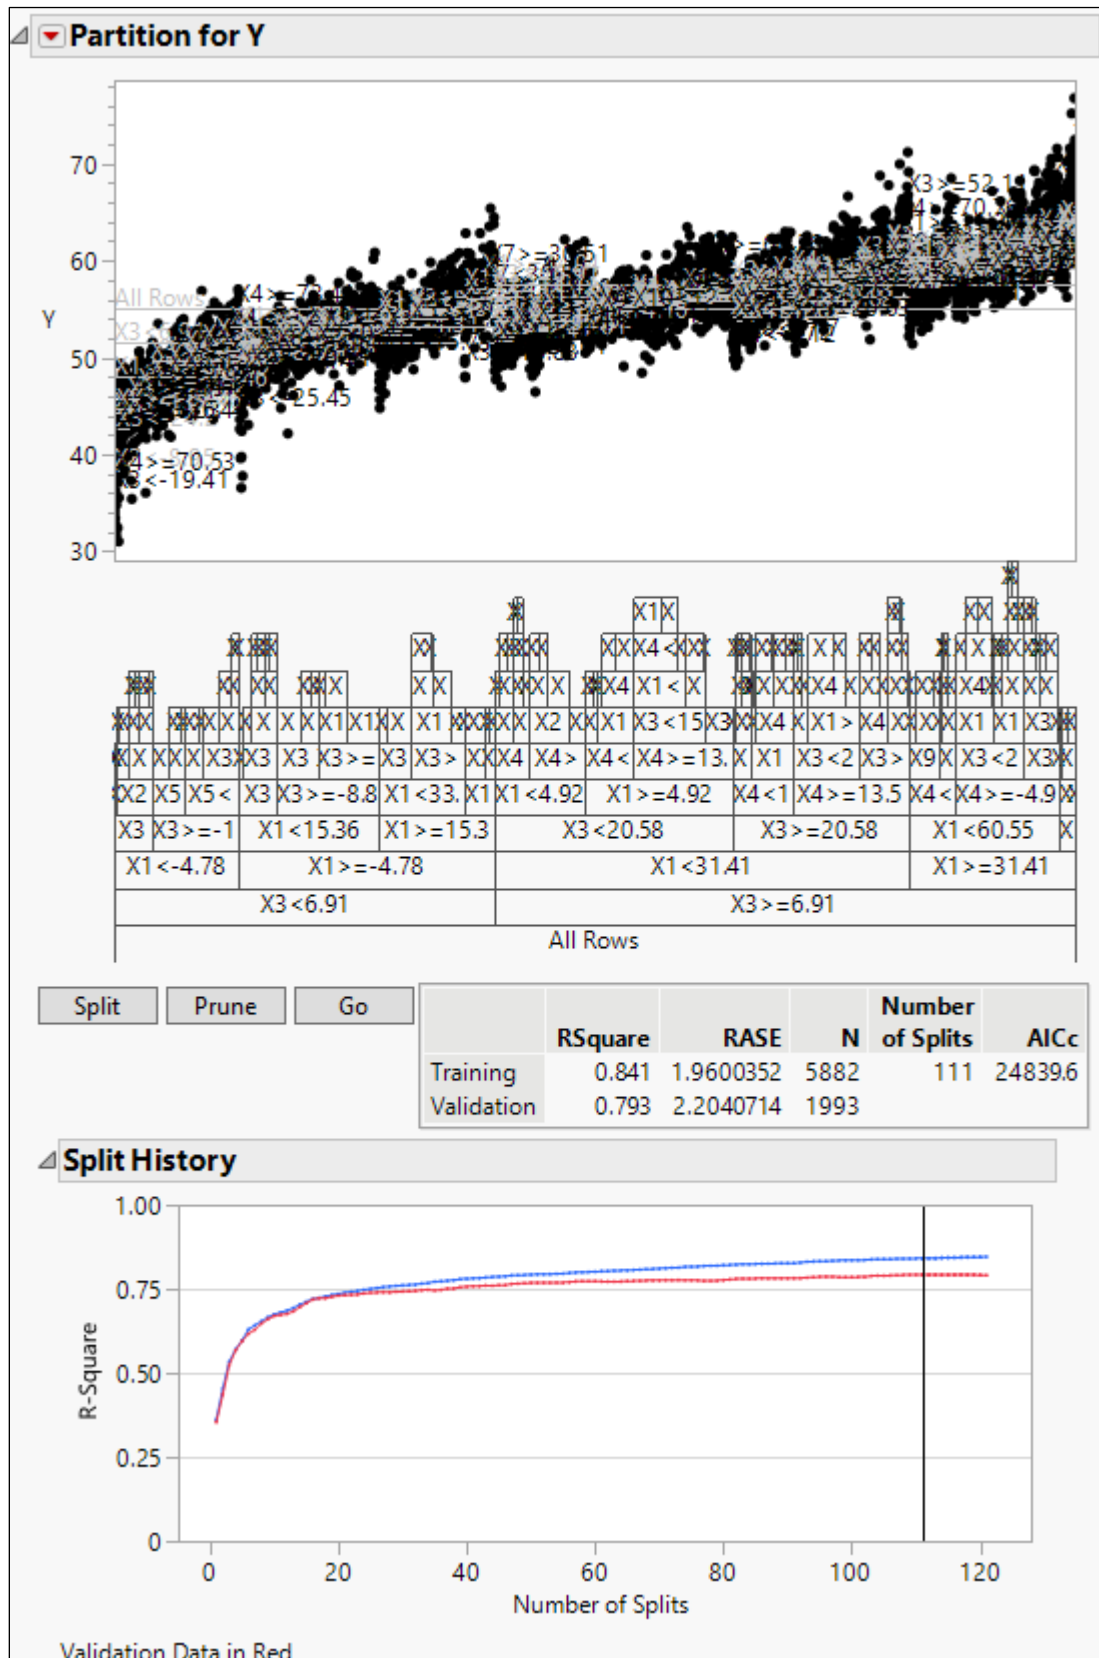

Select Columns	Cast Selected Columns into Roles	Action

5) Click **OK**.

Your results will be slightly different because your validation data are different.

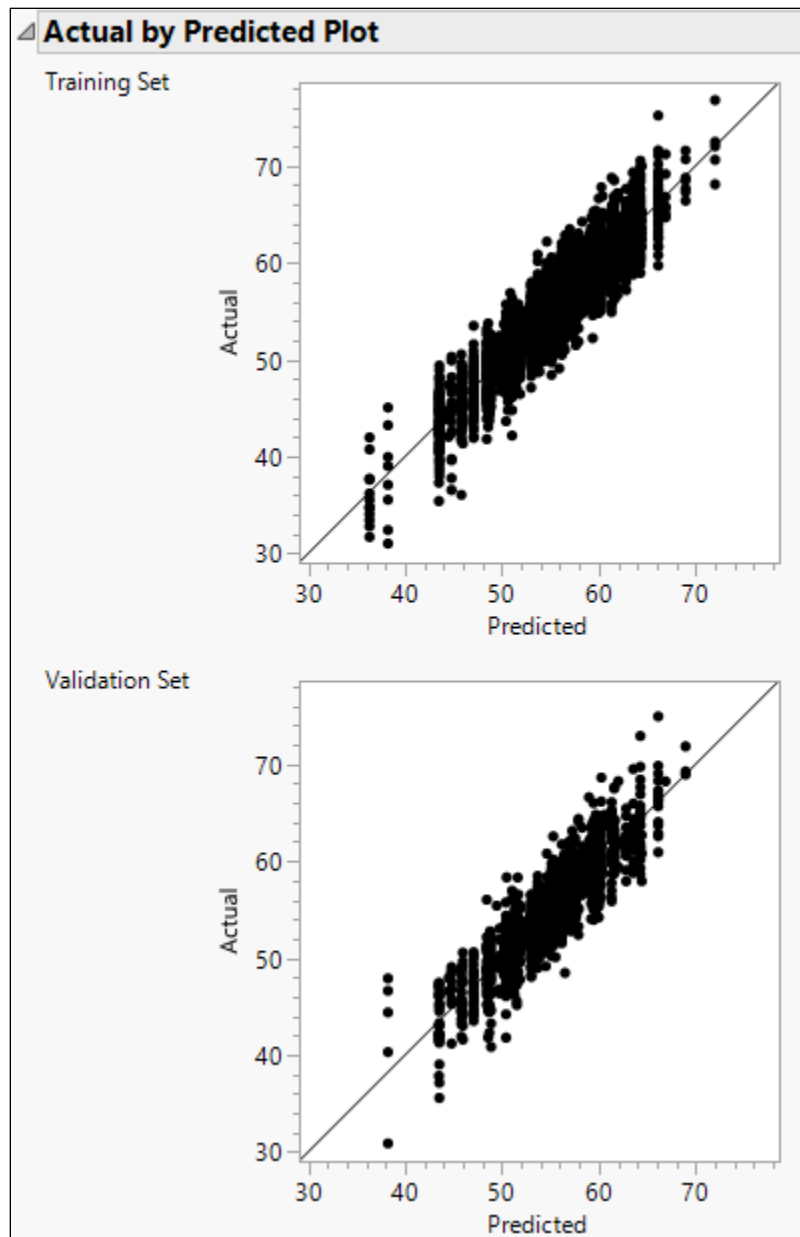

6) Click **Go**.

The data are split until the next 10 splits do not improve R^2 on the validation set, then the model is pruned back. R^2 on the validation set is about 79%, a decrease from the linear model or the neural network model. There were 111 splits.

Assess the model.

- 7) Click the red triangle next to **Partition for Y**, then select **Plot Actual by Predicted**.

There are no problems evident in the model fit.

- 8) Click the red triangle next to **Partition for Y**, then select **Column Contributions**.

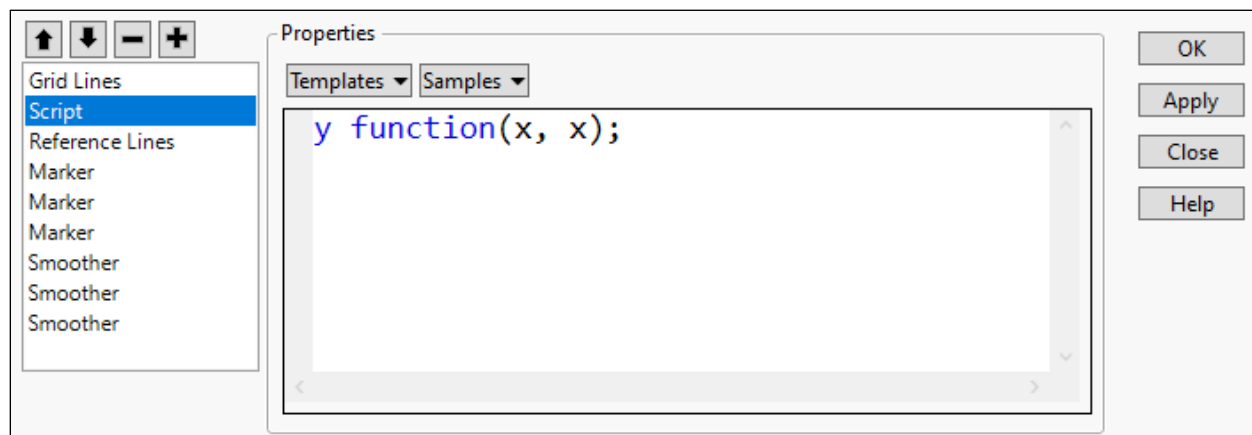

Column Contributions				
Term	Number of Splits	SS		Portion
X3	27	70525.3467		0.5885
X1	26	36712.7253		0.3064
X4	24	6877.58535		0.0574
X9	11	1933.18861		0.0161
X2	4	1234.13734		0.0103
X5	4	953.721499		0.0080
X7	7	821.028473		0.0069
X8	4	438.137833		0.0037
X10	3	259.199041		0.0022
X6	1	74.272536		0.0006

The report is ordered by the portion of variability in Y explained by the predictors. X3, X1, and X4 are the top three predictors.

Save the prediction formula.

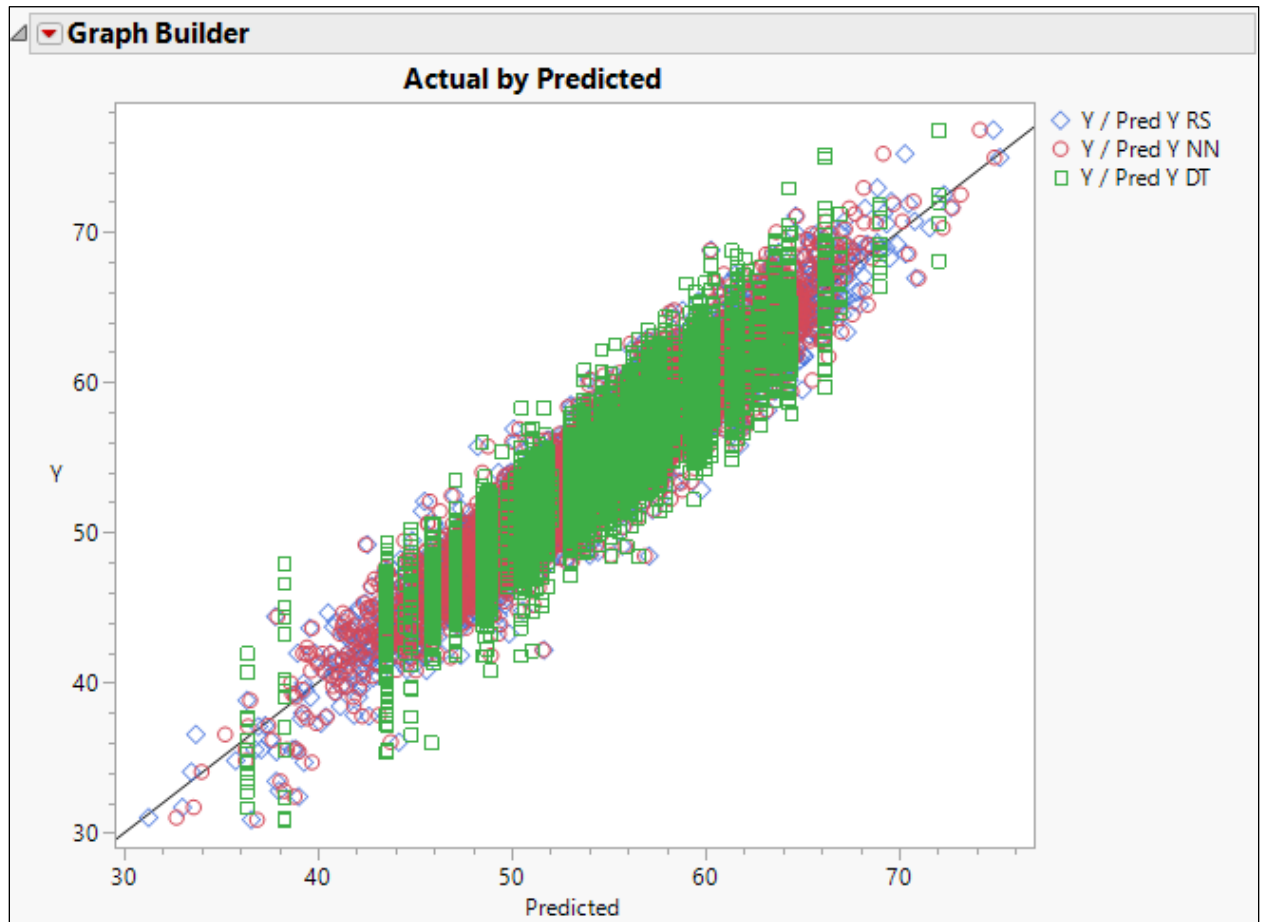

- 9) Click the red triangle next to **Partition for Y**, then select **Save Columns > Save Prediction Formula**.
 - 10) Click the red triangle next to **Partition for Y**, then select **Save Script > To Data Table**.
 - 11) Click **OK**.
 - 12) Return to the data table and rename the last column to **Pred Y DT**.
 - 13) Save the data table.
- e. Build an Actual by Predicted graph for the three models using Graph Builder. Which model do you prefer?
- 1) Select **Graph > Graph Builder**.
 - 2) Drag **Y** to the Y zone.
 - 3) Drag **Pred Y RS**, **Pred Y NN**, and **Pred Y DT** to the X zone together.
 - 4) Right-click in the graph and select **Customize**.
 - 5) Click the plus sign icon  to add a new graphics script.

- 6) Enter `y function(x, x);` in the script editor box.

- 7) Click **OK**.
- 8) Remove the smooth curve.
- 9) Click **Done**.

- 10) If you are going to publish this graph, change the graph title to Actual by Predicted, change the X axis title to Predicted, and change the markers for each X variable.

The fits are fairly similar. The decision tree model gives chunky predictions because it is using discrete leaves to predict a continuous response.

Categorical response, continuous and categorical predictors

2. Use the data in PM 2.jmp to build predictive models.

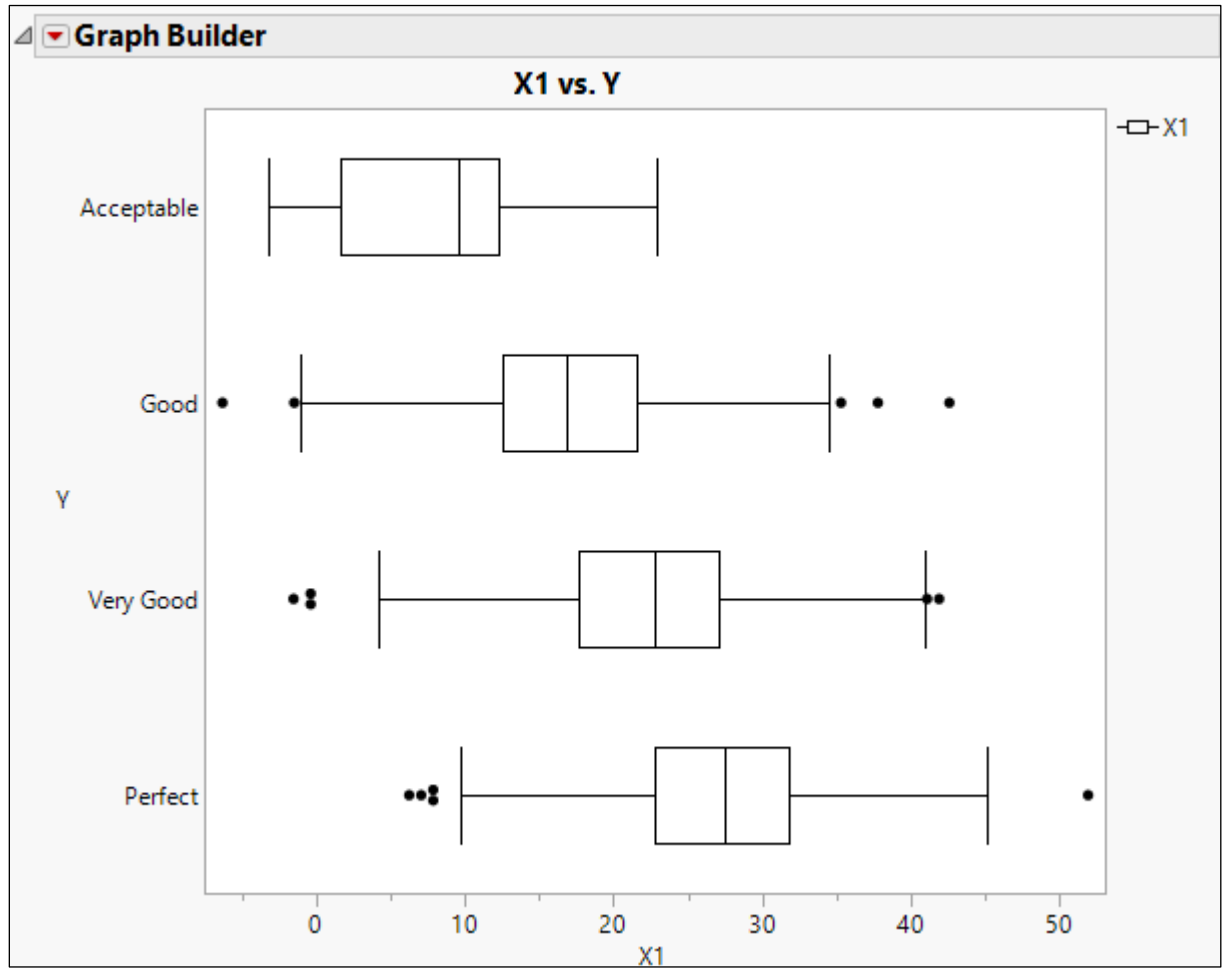

a. Visualize the data using Graph Builder. Are there any data problems?

1) Open **PM 2.jmp**.

- 2) Select **Graph > Graph Builder**.
- 3) Drag **Y** to the Y zone.
- 4) Drag **X1** to the X zone.
- 5) Select the **Boxplot** element on the Elements bar.

6) Click **Done**.

7) Click the red triangle next to **Graph Builder** and select **Redo > Column Switcher**.

- 8) In the Select Replacement Columns box, select all continuous columns.

- 9) Click **OK**.

Several strong relationships between Y and the predictors can be seen.

Build visualizations for the categorical predictors.

- 10) Select **Graph > Graph Builder**.
- 11) Drag **Y** to the Y zone.
- 12) Drag **X13** to the X zone.
- 13) Drag **X18** to the X axis to the right of **X13**.
- 14) Select the Heatmap element from the Elements bar.
- 15) Click **Done**.

There appears to be an association between Y and both categorical predictors.

No data problems are evident in either graph.

- b. Build an ordinal regression model using Fit Model and the Response Surface macro. What is the misclassification rate of the full model? Hint: open the Fit Details report. What is the misclassification rate for the Acceptable group? Hint: open the Confusion Matrix report.
 - 1) Select **Analyze > Fit Model**.
 - 2) Select **Y**, then click **Y**.

- 3) Select **X1** through **X24**, then click **Macros > Response Surface**.
