Presentation outline

- 1** Potency testing of biologics
- 2** Using microtiter plates in bioassays
- 3** Plate bias and uniformity
- 4** JMP demo

Putting Potency Assays into Drug R&D Perspective

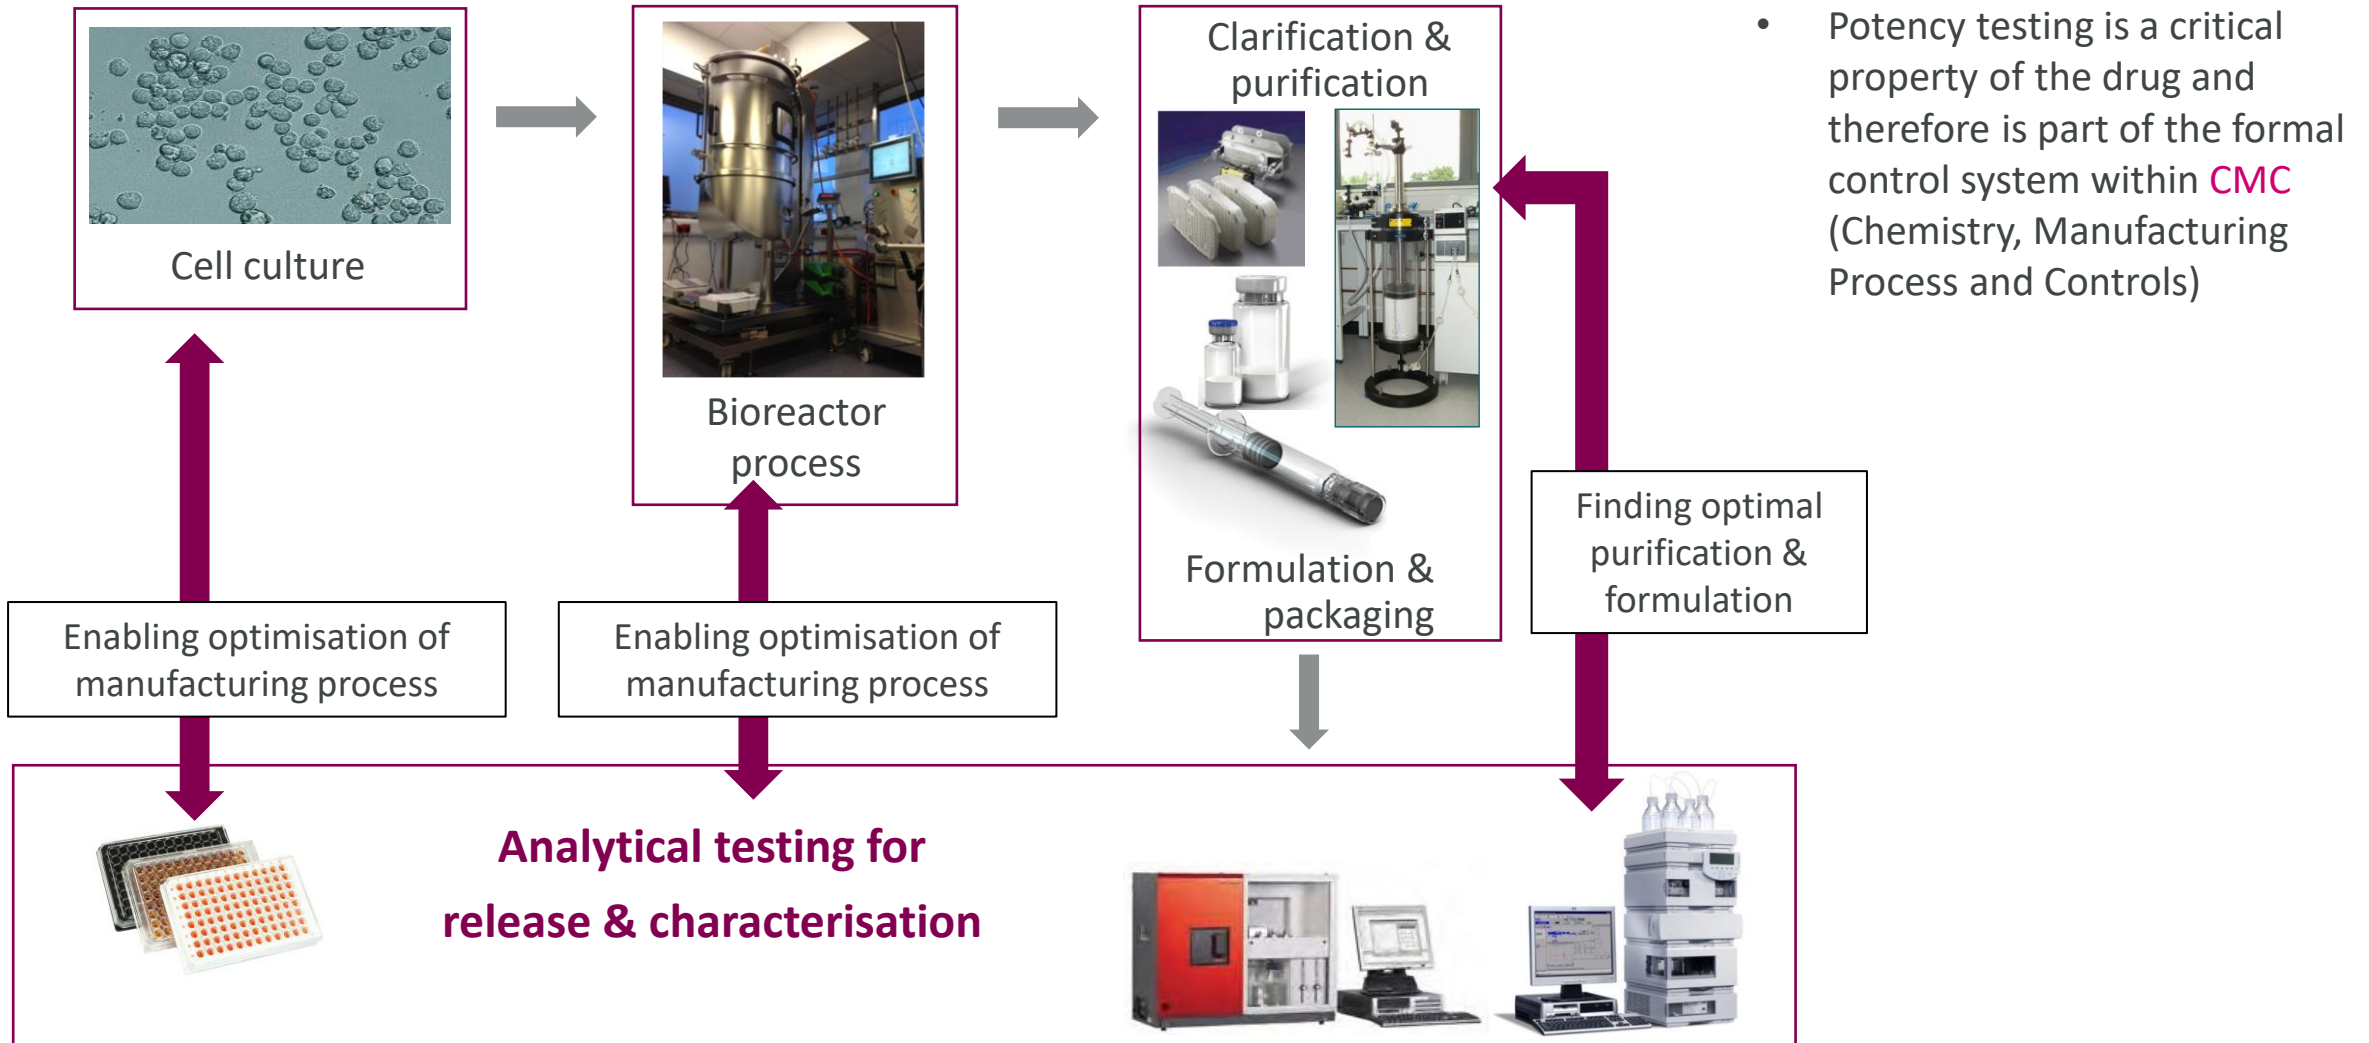

Which molecule has biological activity?

Is the biological activity at a similar level between lots?
(Lot-to-lot consistency)

Potency assays as part of a typical biopharmaceutical manufacturing process

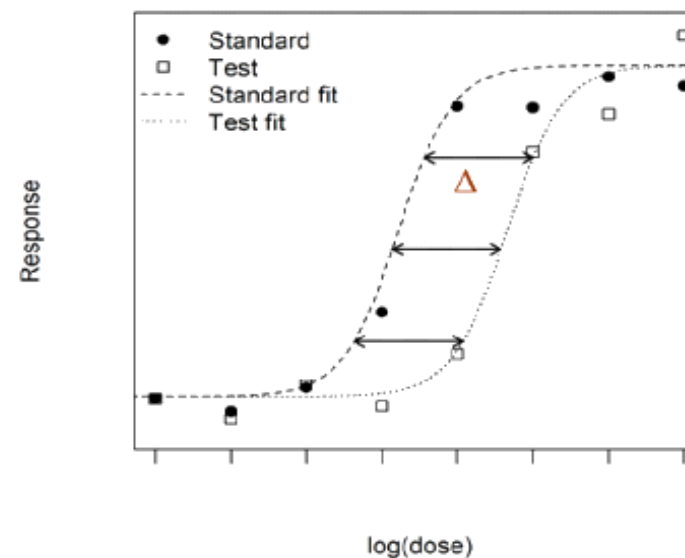

Screening vs potency assays - measuring biological activity

Screening/Selection Bioassays:
Resolve log scale differences
between
different drugs

https://www.quantics.co.uk/qubas-bioassay-software2/qubashelp/relative_potency_1.htm

CMC Potency Assays:
Resolve within 2 fold change
between
different lots of the same drug

Common types of potency assays

Non cell-based target binding assays

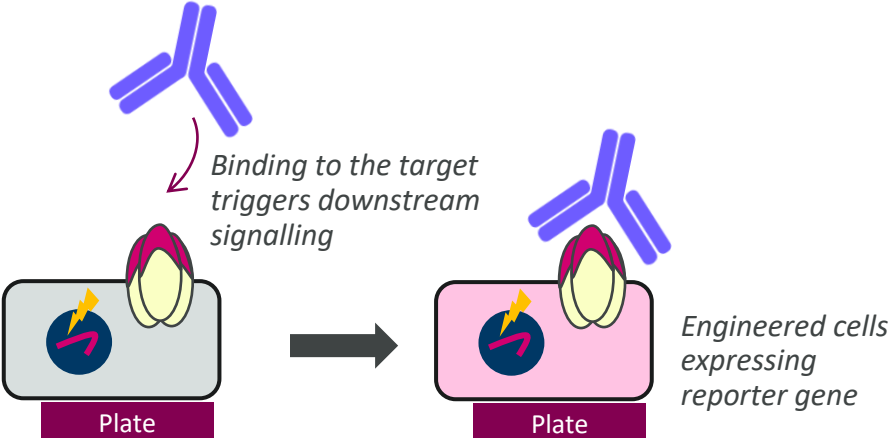

Cell-based target binding assays

- Quantification of target binding

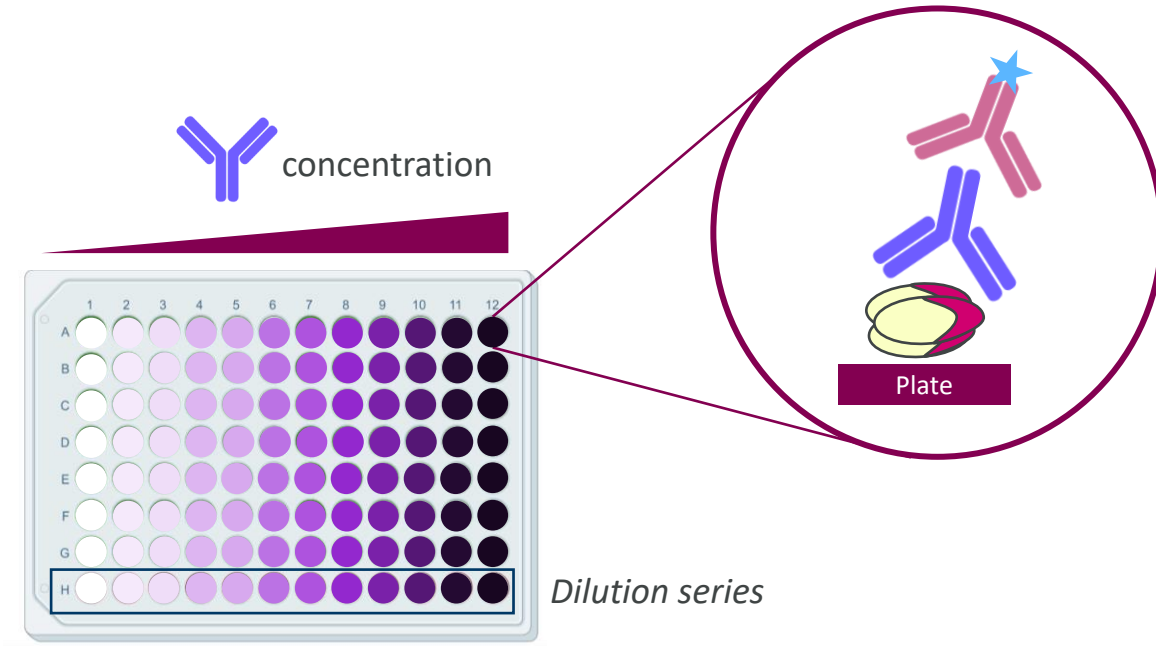

Cell-based reporter assays

- Quantification of effect of target binding – activation/inhibition

Microtiter plates in potency assays

- Most common type: 96-well
- Less common: 384-well and 1536-well
- 1 assay run = one or multiple plates (depends on in-plate and plate-to-plate variability)
- On each plate – dilution series of a reference standard and samples

Data and curve fitting in potency testing

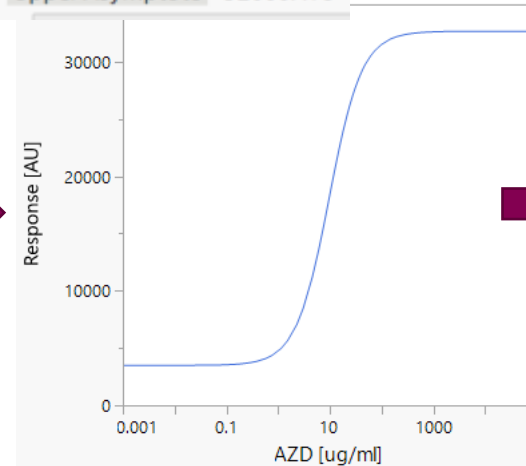

Dilution series

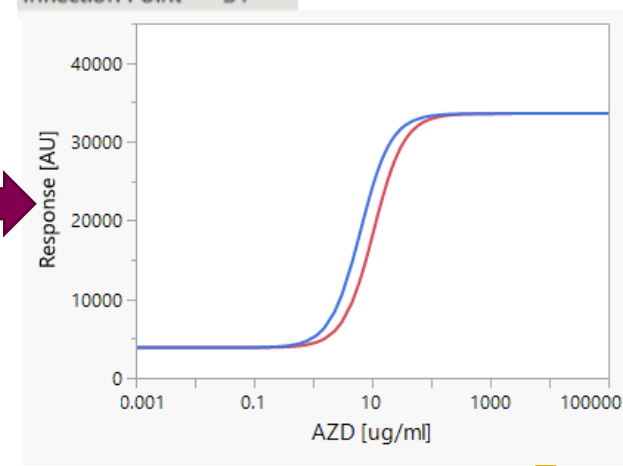

- Response data is used to generate a dose-response model fit (non-linear – 4PL or based on data transformation, e.g., log10)
- Pairwise comparison of fits between the standard and sample with shared lower and upper asymptotes, and growth rate
- **Inflection point** (EC_{50} or IC_{50}) difference = % relative potency

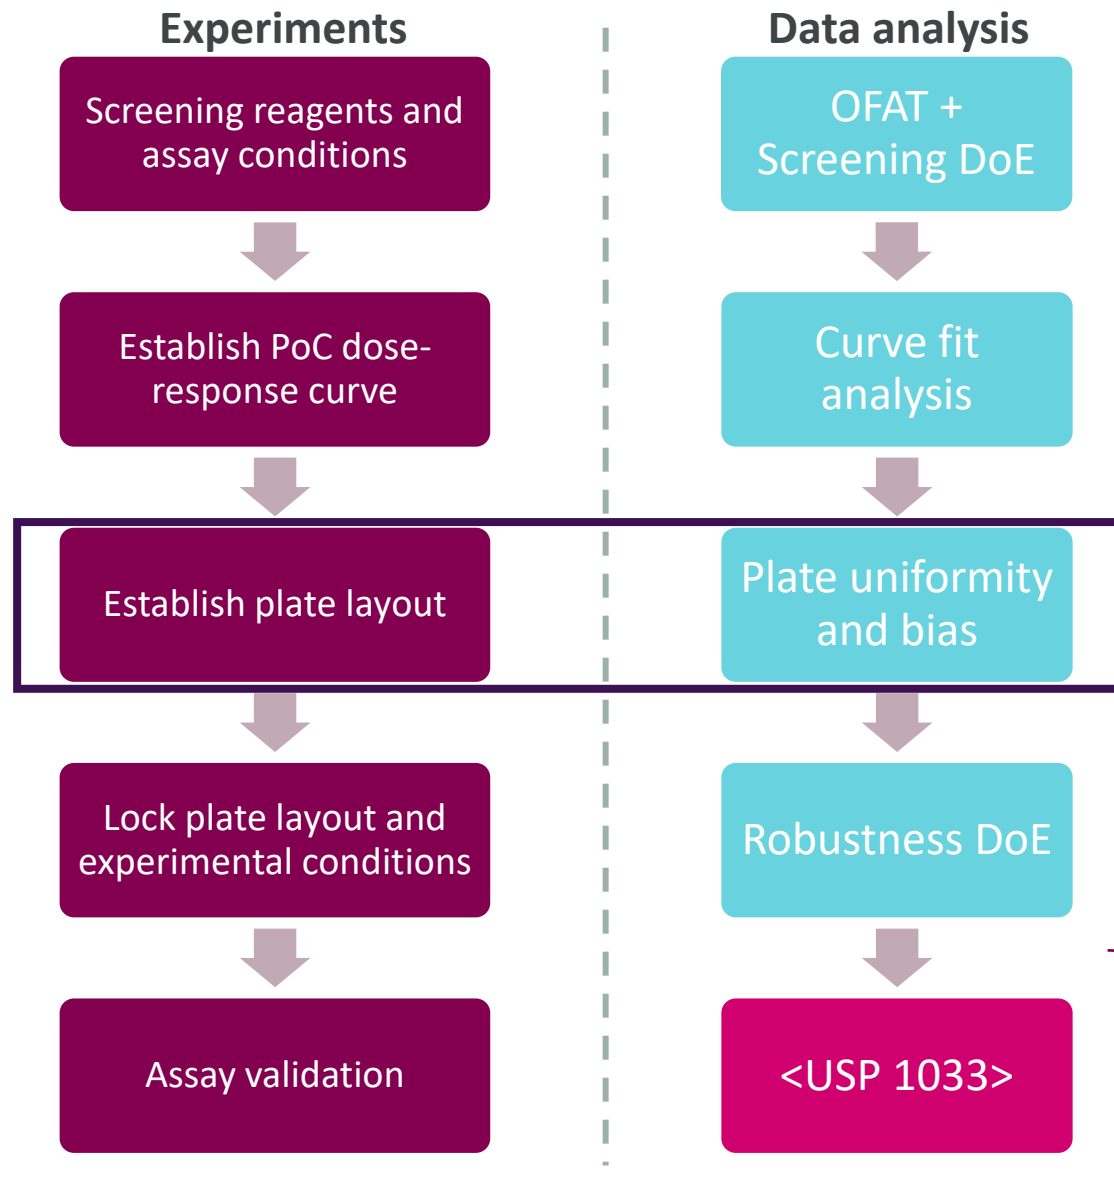

Parameter	Estimate
Growth Rate	-1.369586
Inflection Point	9.6884903
Lower Asymptote	3492.698
Upper Asymptote	32666.478

Parameter	Group
Growth Rate	
Lower Asymptote	
Upper Asymptote	
Inflection Point	RS
Inflection Point	S1

Potency assay development

■ Can be performed with JMP

- Accuracy
- Linearity
- Precision
- Range
- Specificity
- Stability - indicating potential

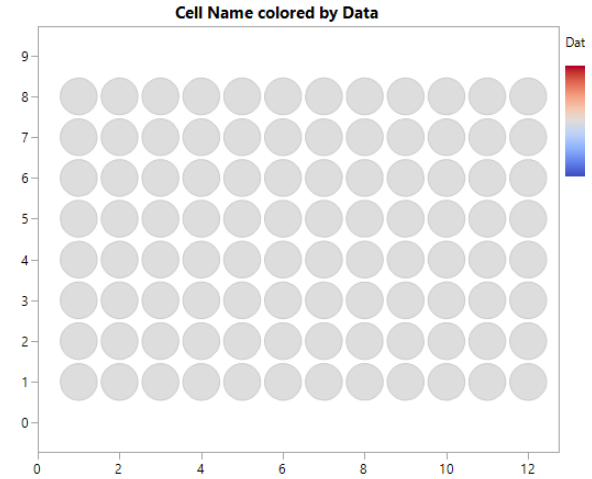

Plate bias

Constant concentration

Ideally...

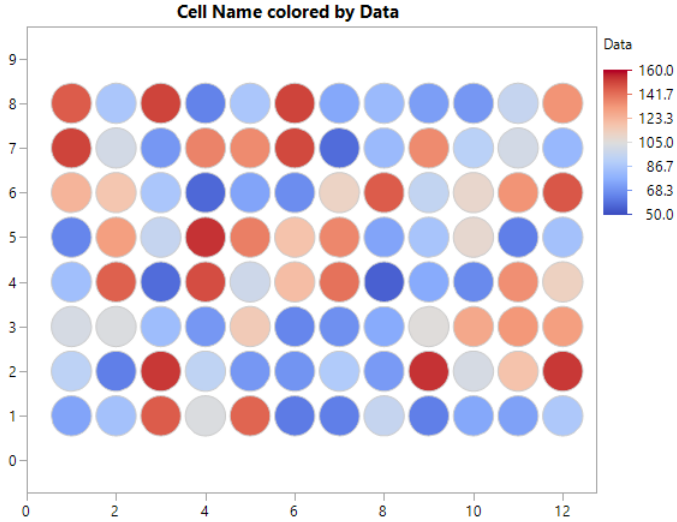

In reality...

Variability is inevitable but needs to be understood and controlled...

Scale matters!

Analysis by plate row

JMP offers great graphical and statistical tools for plate bias analysis

Patterns of variability can be non-random

 Constant concentration

Changes in average responses

 Constant concentration

Changes in variability

Case study – plate uniformity

- Many binding assays have similar step but they can differ + differences in liquid volumes, incubation times, buffers, reagent concentrations and plate types used
- Plate uniformity has to be conducted for every assay we develop
- Many potential sources of variability, including the operator

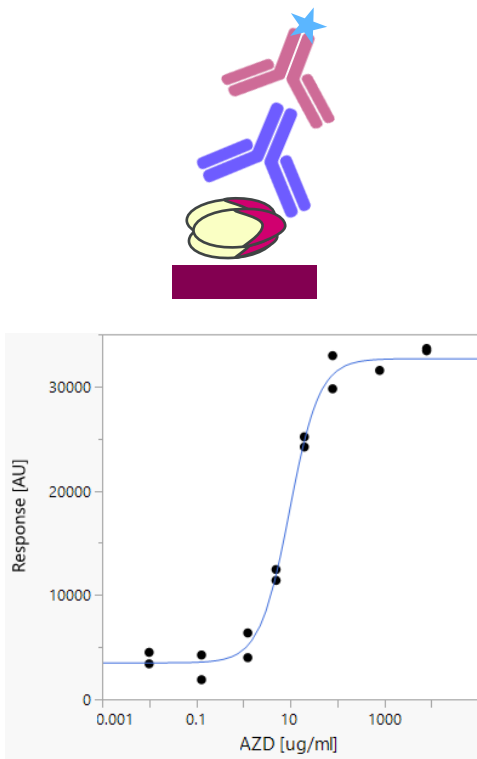

Improved analysis workflow

Data import into JMP

Plate heatmaps generation

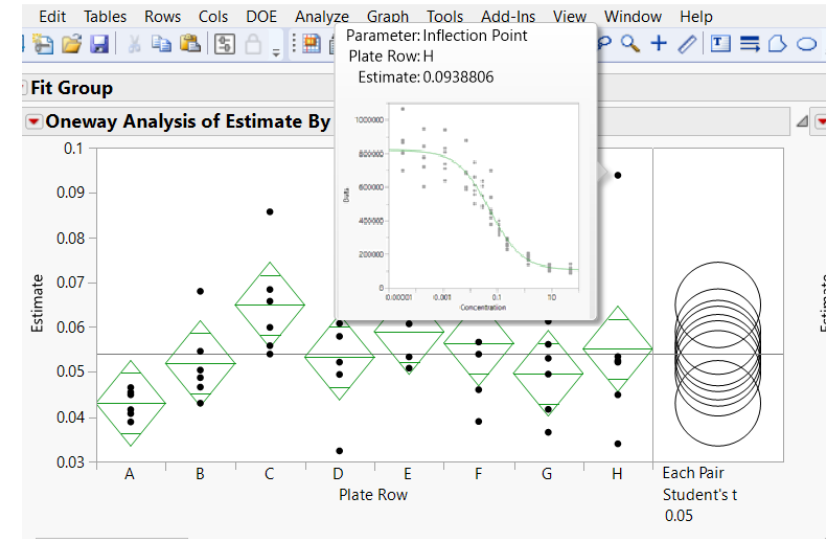

Curve bias analysis

Detection and elimination of outliers ("hot spots")

Fully employing JMP interactivenss

Demonstration in JMP

Benefits of the new tool

- Removal of manual, error-prone copy-paste of data
- “One stop-shop” for plate bias and uniformity analysis with most statistically sound models already chosen for users
- Plate heat map generation options allow removal of obvious data outliers to focus on “true” variability analysis
- Interconnectivity of curve analysis with plate row/column variability analysis
- More in-depth analysis of uncertainty in calculation of EC_{50}/IC_{50} possible

Aiding and speeding up development of robust potency assays
